

CKD: the forgotten risk factor for CVD *and* an important health equity challenge

- ① What is CKD and why is it a risk factor for CVD
- ② Epidemiology and population health of chronic kidney disease (CKD)
- ③ Housing the kidney in cardiometabolic disease in clinical practice
- ④ Changing the trajectory of CKD
- ⑤ Quality improvement opportunities and data

We know we have a national problem with health inequalities related to CVD (and CKD)

REDUCING HEALTHCARE INEQUALITIES

The **Core20PLUS5** approach is designed to support Integrated Care Systems to drive targeted action in health inequalities improvement

CORE20
The most deprived **20%** of the national population as identified by the Index of Multiple Deprivation

Target population

PLUS
ICS-chosen population groups experiencing poorer-than-average health access, experience and/or outcomes, who may not be captured within the Core20 alone and would benefit from a tailored healthcare approach e.g. inclusion health groups

CORE20 PLUS 5

Key clinical areas of health inequalities

1 MATERNITY
ensuring continuity of care for **75%** of women from BAME communities and from the most deprived groups

2 SEVERE MENTAL ILLNESS (SMI)
ensuring annual health checks for **60%** of those living with SMI (bringing SMI in line with the success seen in Learning Disabilities)

3 CHRONIC RESPIRATORY DISEASE
a clear focus on Chronic Obstructive Pulmonary Disease (COPD), driving up uptake of Covid, Flu and Pneumonia vaccines to reduce infective exacerbations and emergency hospital admissions due to those exacerbations

4 EARLY CANCER DIAGNOSIS
75% of cases diagnosed at stage 1 or 2 by 2028

5 HYPERTENSION CASE-FINDING
to allow for interventions to optimise blood pressure and minimise the risk of myocardial infarction and stroke

CKD is now recognised in ‘Six High-Risk Conditions for Cardiovascular Disease’ by CVD Prevent

COHORT 1 – people with a coded diagnosis of at least one of the following six high-risk conditions:

- Atrial fibrillation (AF)
- Hypertension
- Familial hypercholesterolaemia (FH) and other hyperlipidaemias
- **Chronic kidney disease (CKD)**
- Non-diabetic hyperglycaemia (NDH)
- Type 1 or type 2 diabetes mellitus

Data Extraction

- Coding
- Prescribing
- Management according to guidance

First Report Dec 2021

What is Chronic Kidney Disease? (CKD)

‘The presence of **kidney damage**, mainly **albuminuria**, and/or decreased kidney function (estimated glomerular filtration rate [eGFR] **<60 mL/min/1.73 m²**) for at least 3 months (Levey and Coresh, 2012)’

eGFR Calculated by CKD-EPI equation

Albuminuria not proteinuria testing

Recent Key Changes:
No longer use ethnicity correction for eGFR Calculation (NICE CKD Guidelines 2021)

Classification of chronic kidney disease using GFR and ACR categories

GFR and ACR categories and risk of adverse outcomes			ACR categories (mg/mmol), description and range		
			<3 Normal to mildly increased	3–30 Moderately increased	>30 Severely increased
			A1	A2	A3
GFR categories (ml/min/1.73 m ²), description and range	≥90 Normal and high	G1	No CKD in the absence of markers of kidney damage		
	60–89 Mild reduction related to normal range for a young adult	G2			
	45–59 Mild–moderate reduction	G3a ¹			
	30–44 Moderate–severe reduction	G3b			
	15–29 Severe reduction	G4			
	<15 Kidney failure	G5			

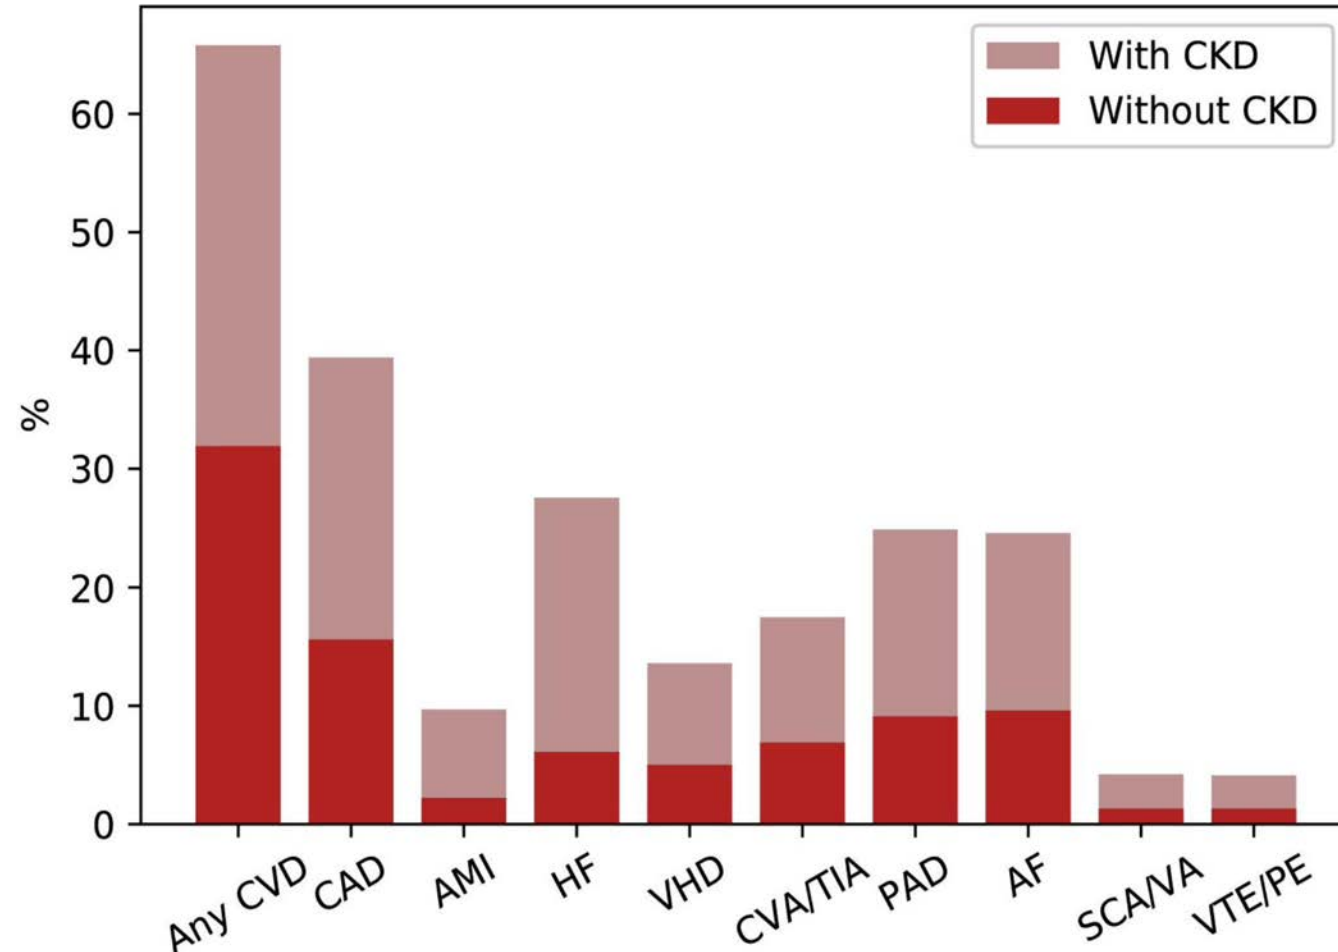

Kidney vasculature is a barometer of cardiovascular health

Approximately 10 km of capillaries in both kidneys

All forms of Cardiovascular Disease are more common in people with CKD

Prevalence of common cardiovascular diseases in patients with or without CKD in United States (2015)

Derived from Provenzano et al 2019

<https://doi.org/10.3389/fcell.2019.00314>

AF, atrial fibrillation; AMI, acute myocardial infarction; CAD, coronary artery disease; CKD, chronic kidney disease; CVA/TIA, cerebrovascular accident/transient ischemic attack; CVD, cardiovascular disease; HF, heart failure; PAD, peripheral arterial disease; SCA/VA, sudden cardiac arrest and ventricular arrhythmias; VHD, valvular heart disease; VTE/PE, venous thromboembolism and pulmonary embolism

People with reduced eGFR are more likely to die from cardiovascular disease than people with a normal eGFR

2x increased risk with CKD Stage 3-5

Adapted from Hallan et al. *Archives Internal Medicine* 2007 167;22;2490-2496
 2. NICE Management of CKD: NICE

Albuminuria is an early marker of cardiovascular disease

AND with microalbuminuria – risk is intensified

Microalbuminuria with eGFR >75 mls/min/1.73m² is associated with **higher risk** of cardiovascular death than CKD Stage 4 without albuminuria

1. Adapted from Hallan et al. *Archives Internal Medicine* 2007 167;22;2490-2496

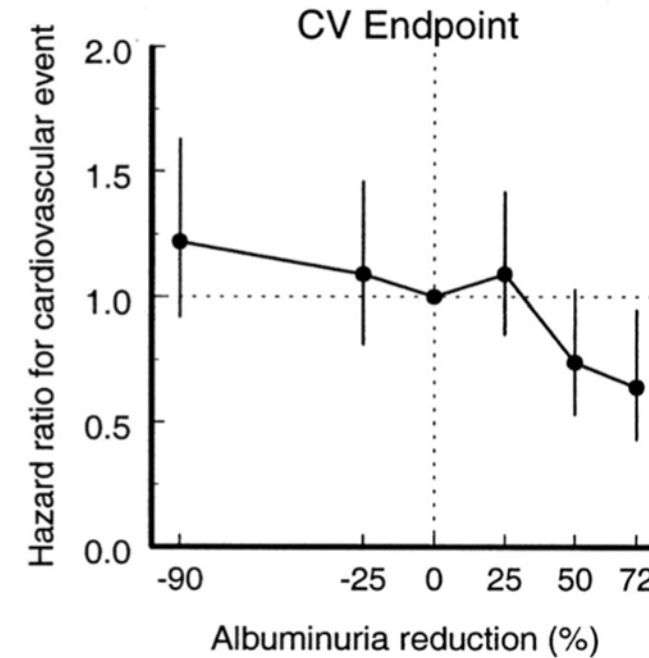

2. NICE Management of CKD: NICE

CKD is a 'stronger' risk factor than diabetes for ALL cardiovascular events

Foley RN, et. al. Am. Soc. Nephrol. 2005

Cardiovascular events are more common with albuminuria and less likely to occur if albuminuria is reduced

Post hoc analysis of 'RENAAL' trial (1513 patients with diabetic nephropathy – Losartan v placebo)

de Zeeuw et al Circulation 2004 DOI: 10.1161/01.CIR.0000139860.33974.28

CKD is associated with unplanned admissions

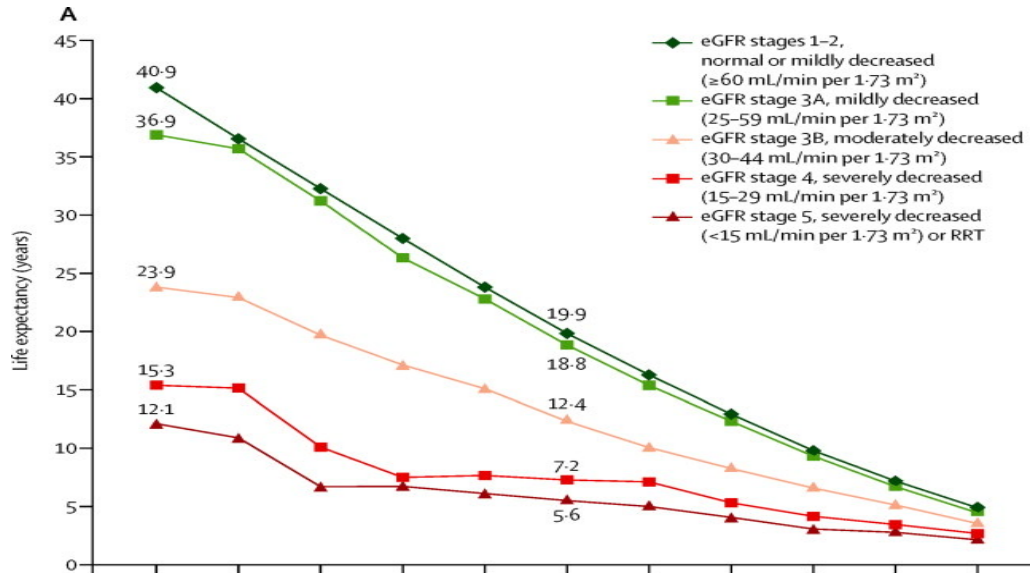

With CKD **Stage 3:**
36 unplanned admissions annually

With CKD **Stage 4:**
75 unplanned admissions annually

 Findings for every
100 Patients

CKD is also associated with reduced life expectancy, even at early stages

Findings for every 100 Patients

With CKD Stage 3:
6 patients die annually

With CKD Stage 4:
19 patients die annually

With other renal codes:
3 patients die annually

National Chronic Kidney Disease Audit // National Report: Part 2 December 2017.
<https://www.lshtm.ac.uk/media/9951..>

End Stage Kidney Disease has **worse** survival rates than colorectal and breast cancer

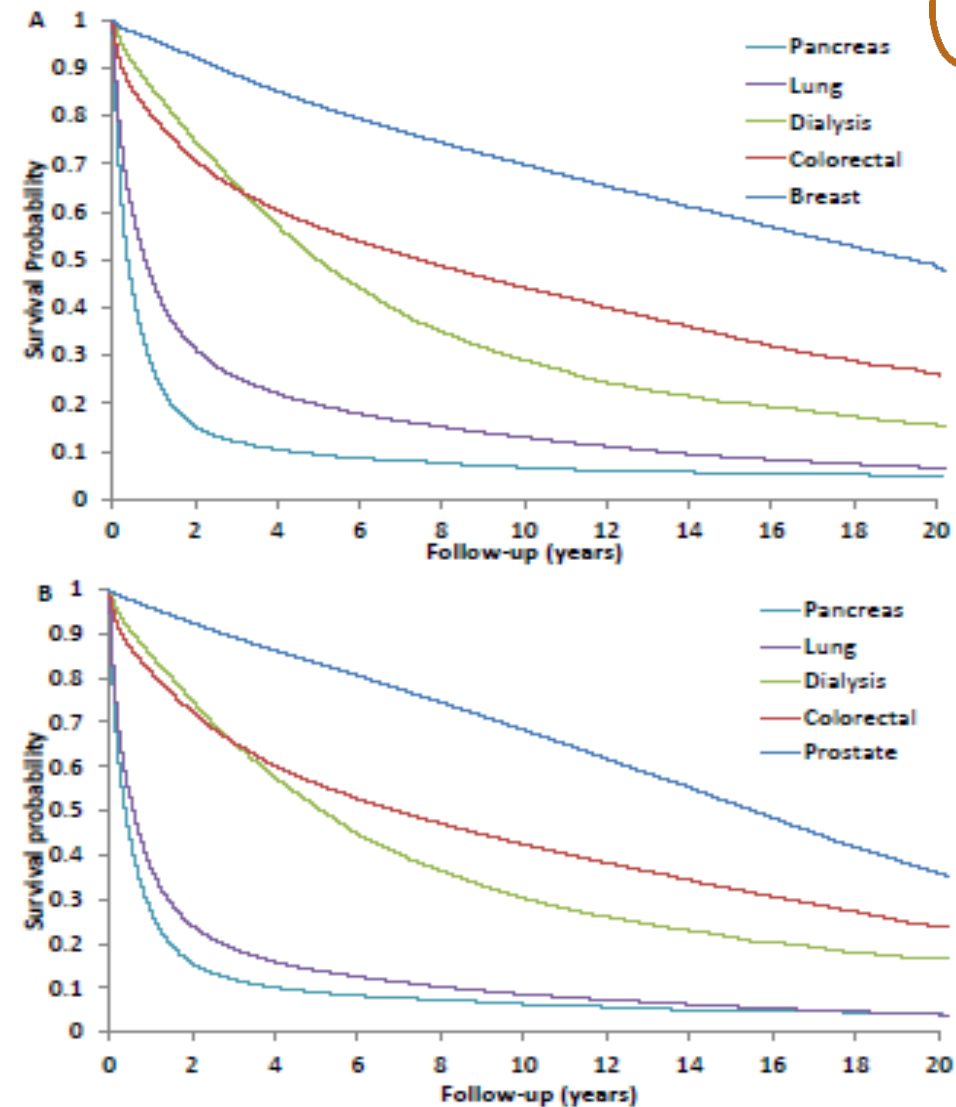

Figure 1. Survival probabilities for all-cause mortality in (A) female maintenance dialysis patients and patients with cancer (log-rank $P < 0.001$) and (B) male maintenance dialysis patients and patients with cancer (log-rank $P < 0.001$).

BIG PROBLEM #1

CKD Epidemic

Epidemiology of chronic kidney disease: an update 2022

Extremely common
843,6 Million in 2017
 Approximately **1 in 10**

More prevalent in:

- Individuals with diabetes mellitus
- Racial minorities
- Women
- Elderly
- Individuals with hypertension

Kovesdy, 2022

CONCLUSION

Chronic kidney disease (CKD) occurs frequently and has devastating consequences. This should prompt major efforts to develop preventative and therapeutic measures that are effective. The aim of these measures should be lowering the incidence of CKD and slowing its progression.

UK Renal Registry 23rd Annual Report
 Data to 31/12/2019

BIG PROBLEM #2

CKD is not equal

PEOPLE FROM LOWER SOCIO-ECONOMIC GROUPS ARE MORE LIKELY TO:

DEVELOP CHRONIC KIDNEY DISEASE > PROGRESS FASTER TOWARDS KIDNEY FAILURE > DIE EARLIER WITH CHRONIC KIDNEY DISEASE

KIDNEY DISEASE MAY ALSO CONTRIBUTE TO SOCIAL DEPRIVATION

PEOPLE FROM BLACK, ASIAN AND MINORITY ETHNIC POPULATIONS

ARE LESS LIKELY TO RECEIVE A KIDNEY TRANSPLANT

ARE MORE LIKELY TO PROGRESS FASTER TOWARDS KIDNEY FAILURE

WOMEN ARE MORE LIKELY TO BE DIAGNOSED WITH CHRONIC KIDNEY DISEASE

MEN ARE MORE LIKELY TO START DIALYSIS THAN WOMEN

OLDER PEOPLE ARE LESS LIKELY TO RECEIVE A KIDNEY TRANSPLANT

Comparison of death rates between uncoded and coded patients with biochemical CKD stages 3-5

Caskey et al (2018) Kidney health inequalities in the United Kingdom: reflecting on the past, reducing in the future."

BIG PROBLEM #3

Nephrology services focus on advanced disease

NICE recommendations for referral to nephrology services GFR <30mls/min/1.73m²

Missed opportunities for management of CKD progression / CVD prevention!

How can we impact the tidal wave of CKD?

Big Problem:

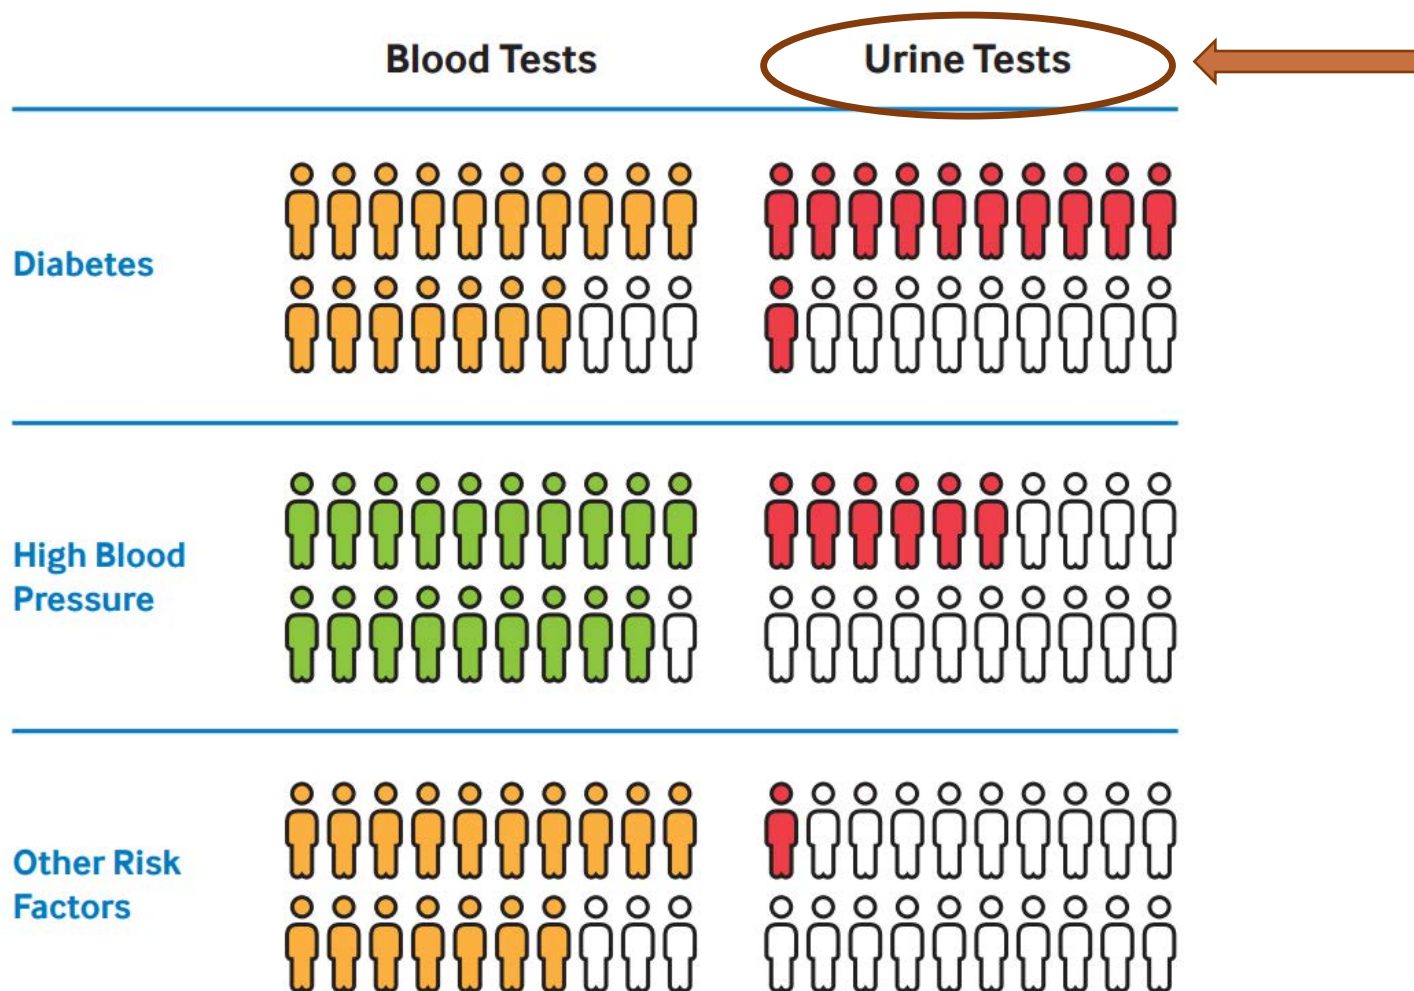

An increasing number of preventable deaths associated with CKD

Solution?

Primary Care Interventions

Identification of CKD: What are the problems?

For people at high risk of CKD, ensure that both blood tests for eGFR and ACR are being included

Improve the coding of patients with CKD

Having identified CKD, regularly review, manage high blood pressure, prescribe cholesterol lowering treatments, and perform vaccinations

Key: There are no formal targets in the guidance, but the audit selected 70% and 90% as quality markers.

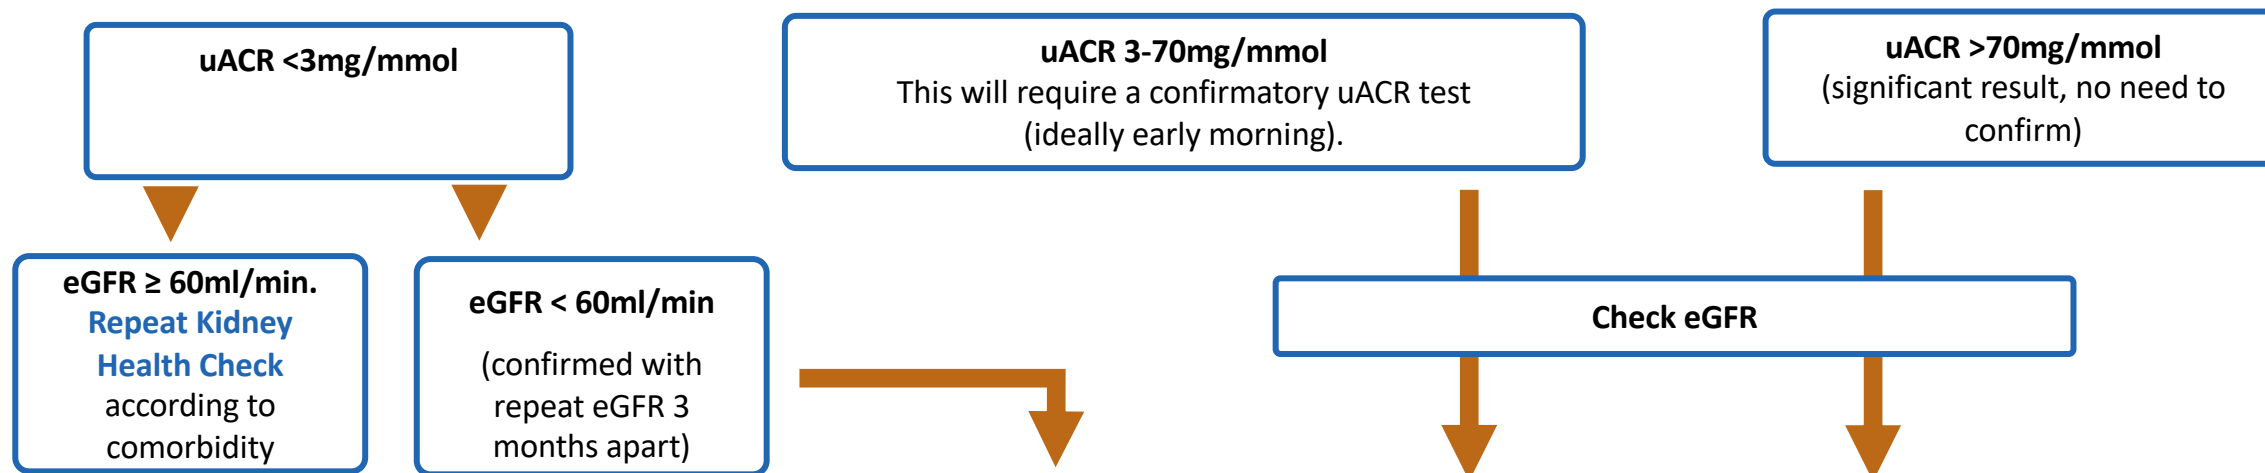

Red < 70% Amber 71-90% Green > 90%

The **Kidney Health Check** for Adults Living with Diabetes or Hypertension: How to identify Chronic Kidney Disease *early!*

What is a Kidney Health Check? It is the combination of both an **eGFR** *and* a **uACR** test

Who should have a **Kidney Health Check**?

1. People living with **diabetes** should have a yearly kidney health check
2. People living with **hypertension** should have a kidney health check every 1-5 years (annually for poorly controlled hypertension).
3. See [NICE CKD Assessment and Management](#) for ACR testing in other health conditions

1. INFORM the patient that they have **Chronic Kidney Disease (CKD)**.
2. If eGFR is < 60ml/min, consider discussing Kidney Failure Risk equation see link: [KFRE](#).
3. Add coding for CKD (including CKD G1 and G2) and albuminuria category, into the patient record.
4. Discuss with the person their uACR number, eGFR number, BP and HbA1c if living with diabetes.
5. Explain what each term means *and* the factors that can cause CKD or diabetic kidney disease: raised BP, raised HbA1c, obesity.
6. Give lifestyle advice and connect them with support services where suitable: weight management enhanced services, exercise, and smoking cessation (see [online guidance](#)). Offer advice on avoiding NSAIDS/sick day rules.
7. Implement the [LKN CKD Optimisation Pathways](#) for proteinuric CKD with and without diabetes.

CKD is not being diagnosed enough

In South East London (SEL), our CKD registers are **half** their expected size^{1,2}

Patients who have CKD but are **not coded**, have **double the mortality rate** and **double the risk of being prescribed nephrotoxic drugs** compared to correctly coded patients³

CKD is not being managed well enough¹¹

Urine ACR

2/3 of patients with CKD in SEL have **not had Urine ACR checked** in the past year

ACE-I/ARB

1/3 of patients with CKD who have proteinuria are **not on an ACE-I/ARB**

Hypertension

1/3 of patients with CKD have **uncontrolled blood pressure**

Lipid lowering therapy

1/4 of patients with CKD are not on lipid lowering therapy

Impact of CKD

CKD is associated with **reduced life expectancy**, even at early stages⁴

CKD is a stronger **risk factor for cardiovascular** events than diabetes⁴

End-stage kidney disease has **worse survival rates than colorectal and breast cancer**⁵

Better treatment is now available for CKD

Dapagliflozin **reduces all cause mortality by 30%** in patients with CKD, and a 37% reduction in significant renal or cardiovascular morbidity⁷

Adding an SGLT2i for patients with diabetes and established nephropathy may **delay their progression** to end-stage kidney disease by 15 years⁶

eGFR fall over time for patients with diabetes and established nephropathy⁶

RAAS blockade in CKD

Relation between hypertension and development of ESRD

SGLT2 inhibition and RAAS blockade both reduce glomerular pressure by complimentary mechanisms

SGLT2 inhibitors

Afferent vasoconstriction

Due to increased Na⁺ delivery to the macula densa¹⁻³

RAAS blockade

Efferent vasodilation

CLINICAL IMPLICATIONS

- Decreased glomerular pressure
- Reduction in albuminuria

- Decreased glomerular pressure
- Reduction in albuminuria

CREDESCENCE: Canagliflozin and renal outcomes in type 2 diabetes and nephropathy

The George Institute
for Global Health

Study design and participants

4401 patients with T2DM & UACR >300 mg/g

62 years

eGFR 57

UACR 927 mg/g

Intervention

Stable on maximum dose tolerated ACEi or ARB for 4 weeks

Canagliflozin Placebo

Outcomes

Primary outcome

(Doubling of serum creatinine, ESKD, death due to cardiovascular or kidney disease)

HR 0.70
(95% CI 0.59-0.82)

NNT 21

End-stage kidney disease

HR 0.68
(95% CI 0.54-0.86)

NNT 42

No increased risk of:

Amputations

HR 1.10
(95% CI 0.79-1.56)

Fractures

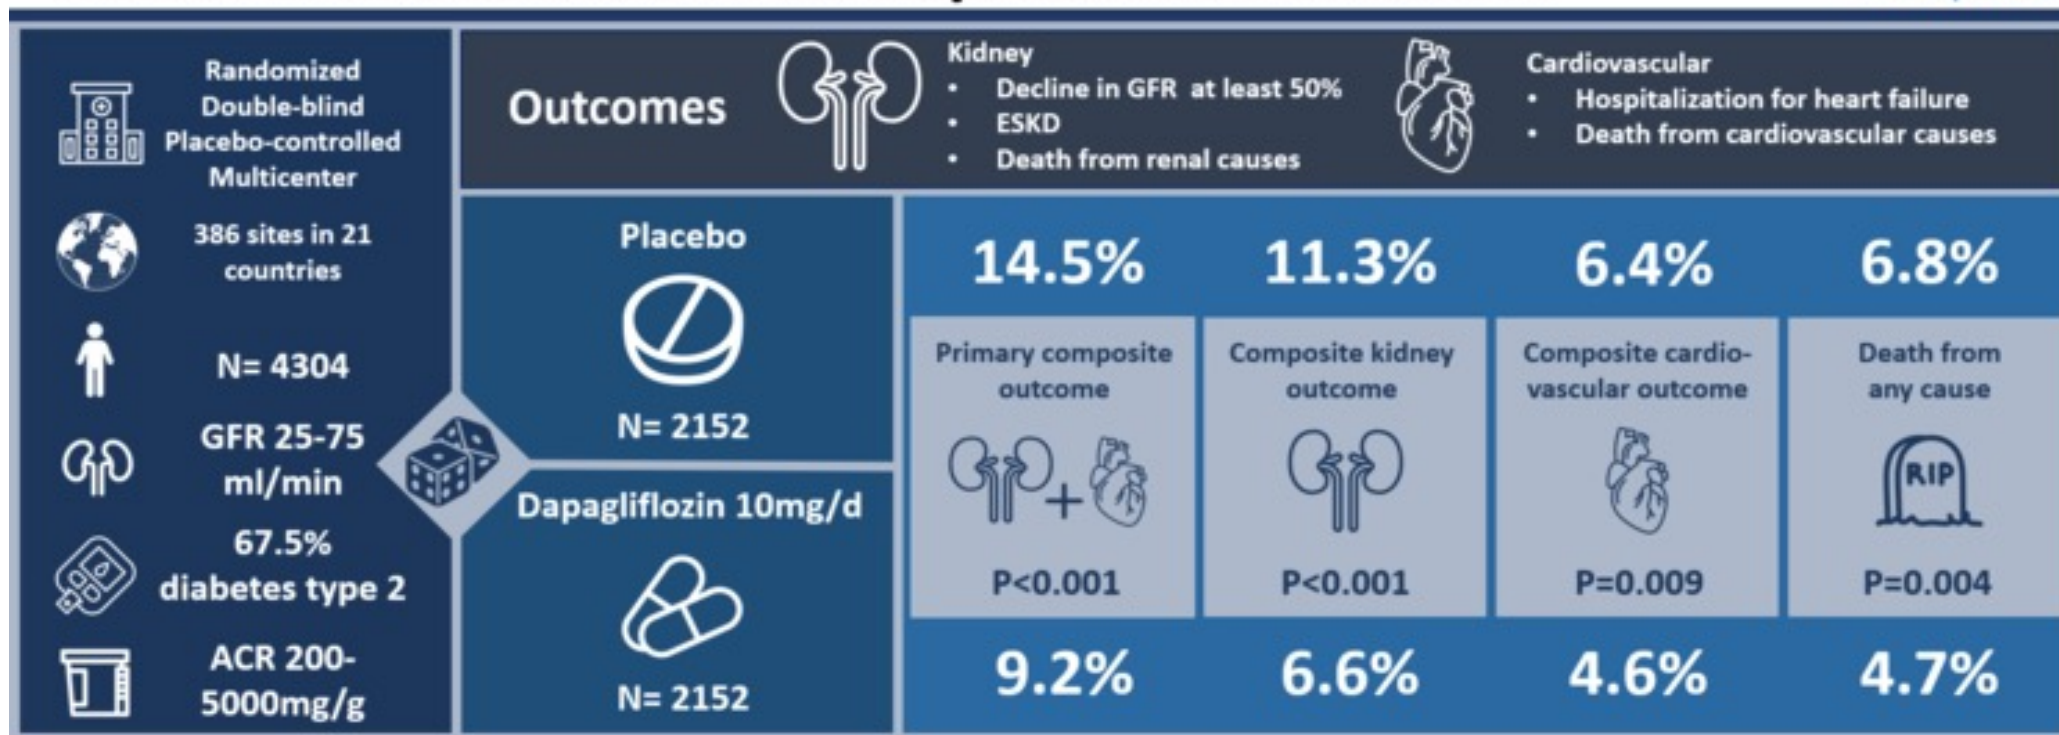

HR 0.98
(95% CI 0.70-1.37)

Conclusion

In patients with type 2 diabetes and kidney disease, canagliflozin reduces the risk of kidney failure and cardiovascular events

Could dapagliflozin improve kidney and cardiovascular outcomes in patients with CKD?

Conclusion: Among patients with chronic kidney disease, the risk of any composite kidney or cardiovascular outcomes or death was significantly lower with dapagliflozin than with placebo.

“3 within 3”

3 key actions within 3 months to save lives

LKN CKD Optimisation Pathway

In adults with Type 2 diabetes and CKD

(uACR > 3mg/mmol)

ACTION 1 (Month 1) Maximum intensity RAS/ RAAS blockade

First, ensure the patient is on a statin, unless contraindicated.
Start ACE-inhibitor or ARB and titrate to maximum tolerated licensed dose (*NICE, NG203*) within one month

ACTION 2 (Month 2) Initiate SGLT-2 inhibitor according to license

Consider/ counsel on risks of diabetic ketoacidosis (which may be euglycaemic), sick day rules, risk of UTI/fungal infections. Consider adjusting sulfonylureas/insulin where eGFR >45ml/min and HbA1c < 58mmol/mol to mitigate risk of hypoglycaemia.

ACTION 3 (Month 3) Initiate further blood pressure agent to target 140/90mmHg unless uACR >70mg/mmol (then 120-129/80mmHg)

If BP remains above target initiate 2nd line BP agents as per NICE guidance (*NG203/ NG136*)

“3 within 3”

3 key actions within 3 months to save lives

LKN CKD Optimisation Pathway

In adults with albuminuria, without Type 2 diabetes

(uACR \geq 22.6mg/mmol and eGFR 25 - 75ml/minute/1.73m²)

ACTION 1 (Month 1)

Maximum intensity RAS/ RAAS blockade

First, ensure the patient is on a statin, unless contraindicated.
Start ACE-inhibitor or ARB unless contraindicated, and titrate to maximum tolerated licensed dose (*NICE, NG203*) within one month

ACTION 2 (Month 2)

Initiate SGLT-2 inhibitor according to license

Counsel patient on sick day rules, and the risk of UTI/fungal infection.

ACTION 3 (Month 3)

Initiate further blood pressure agent to target <140/90mmHg unless uACR >70mg/mmol (then <130/80mmHg)

If BP remains above target initiate 2nd line BP agents as per NICE guidance (*NG203/ NG136*)

And the 4th step: Finerenone in type 2 diabetes

NICE TA877

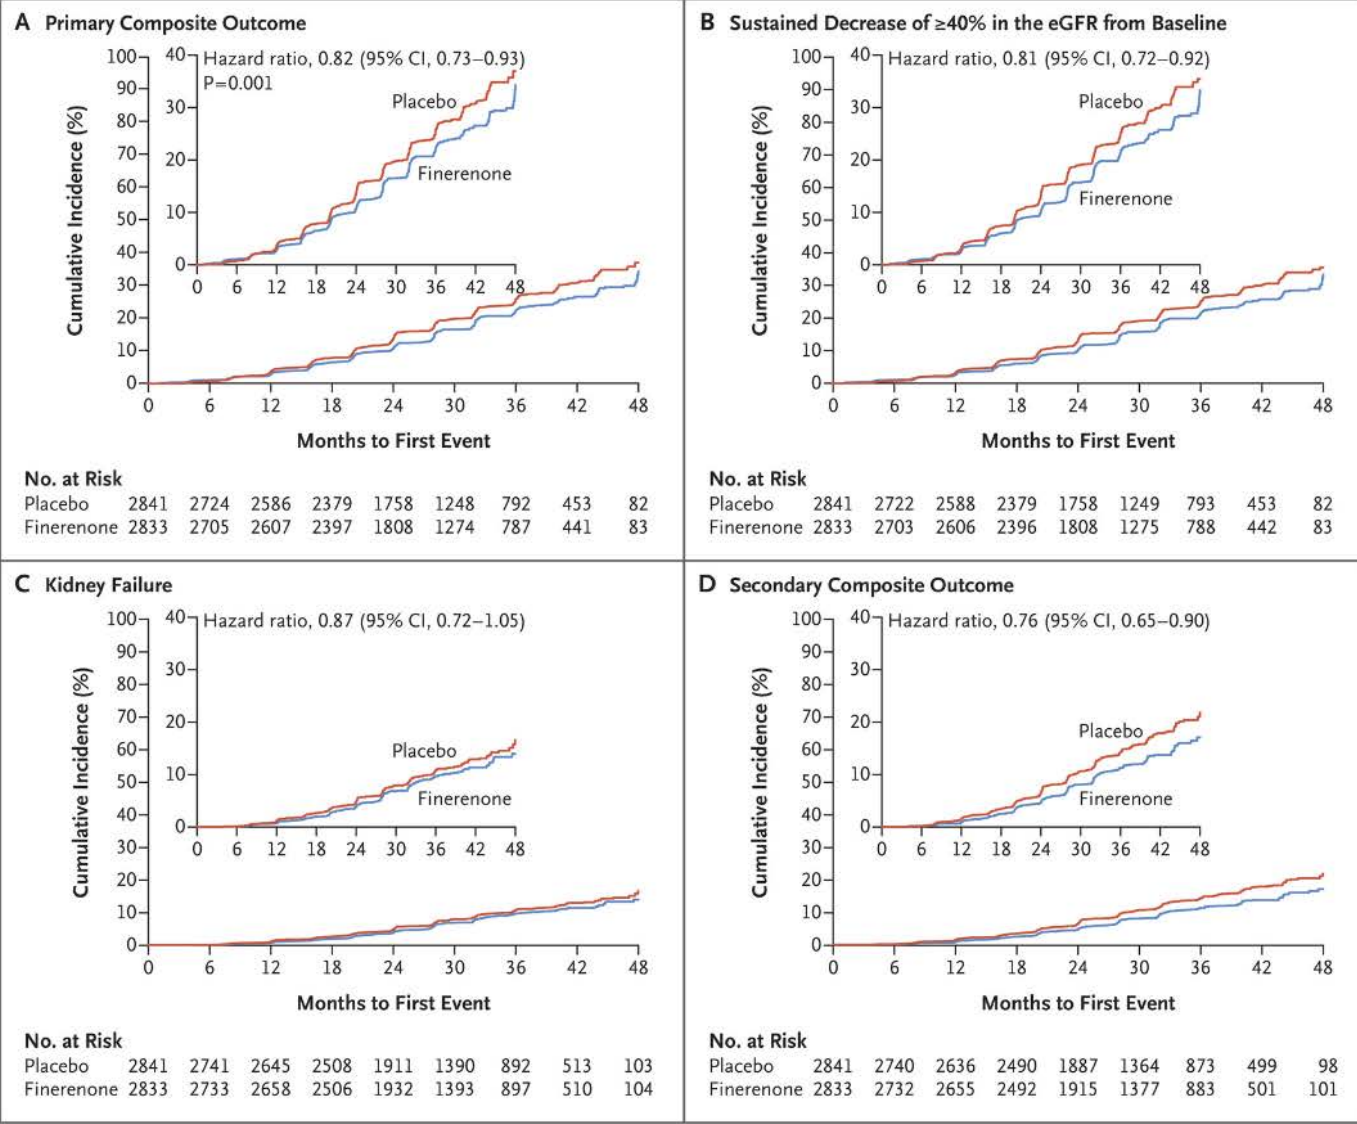

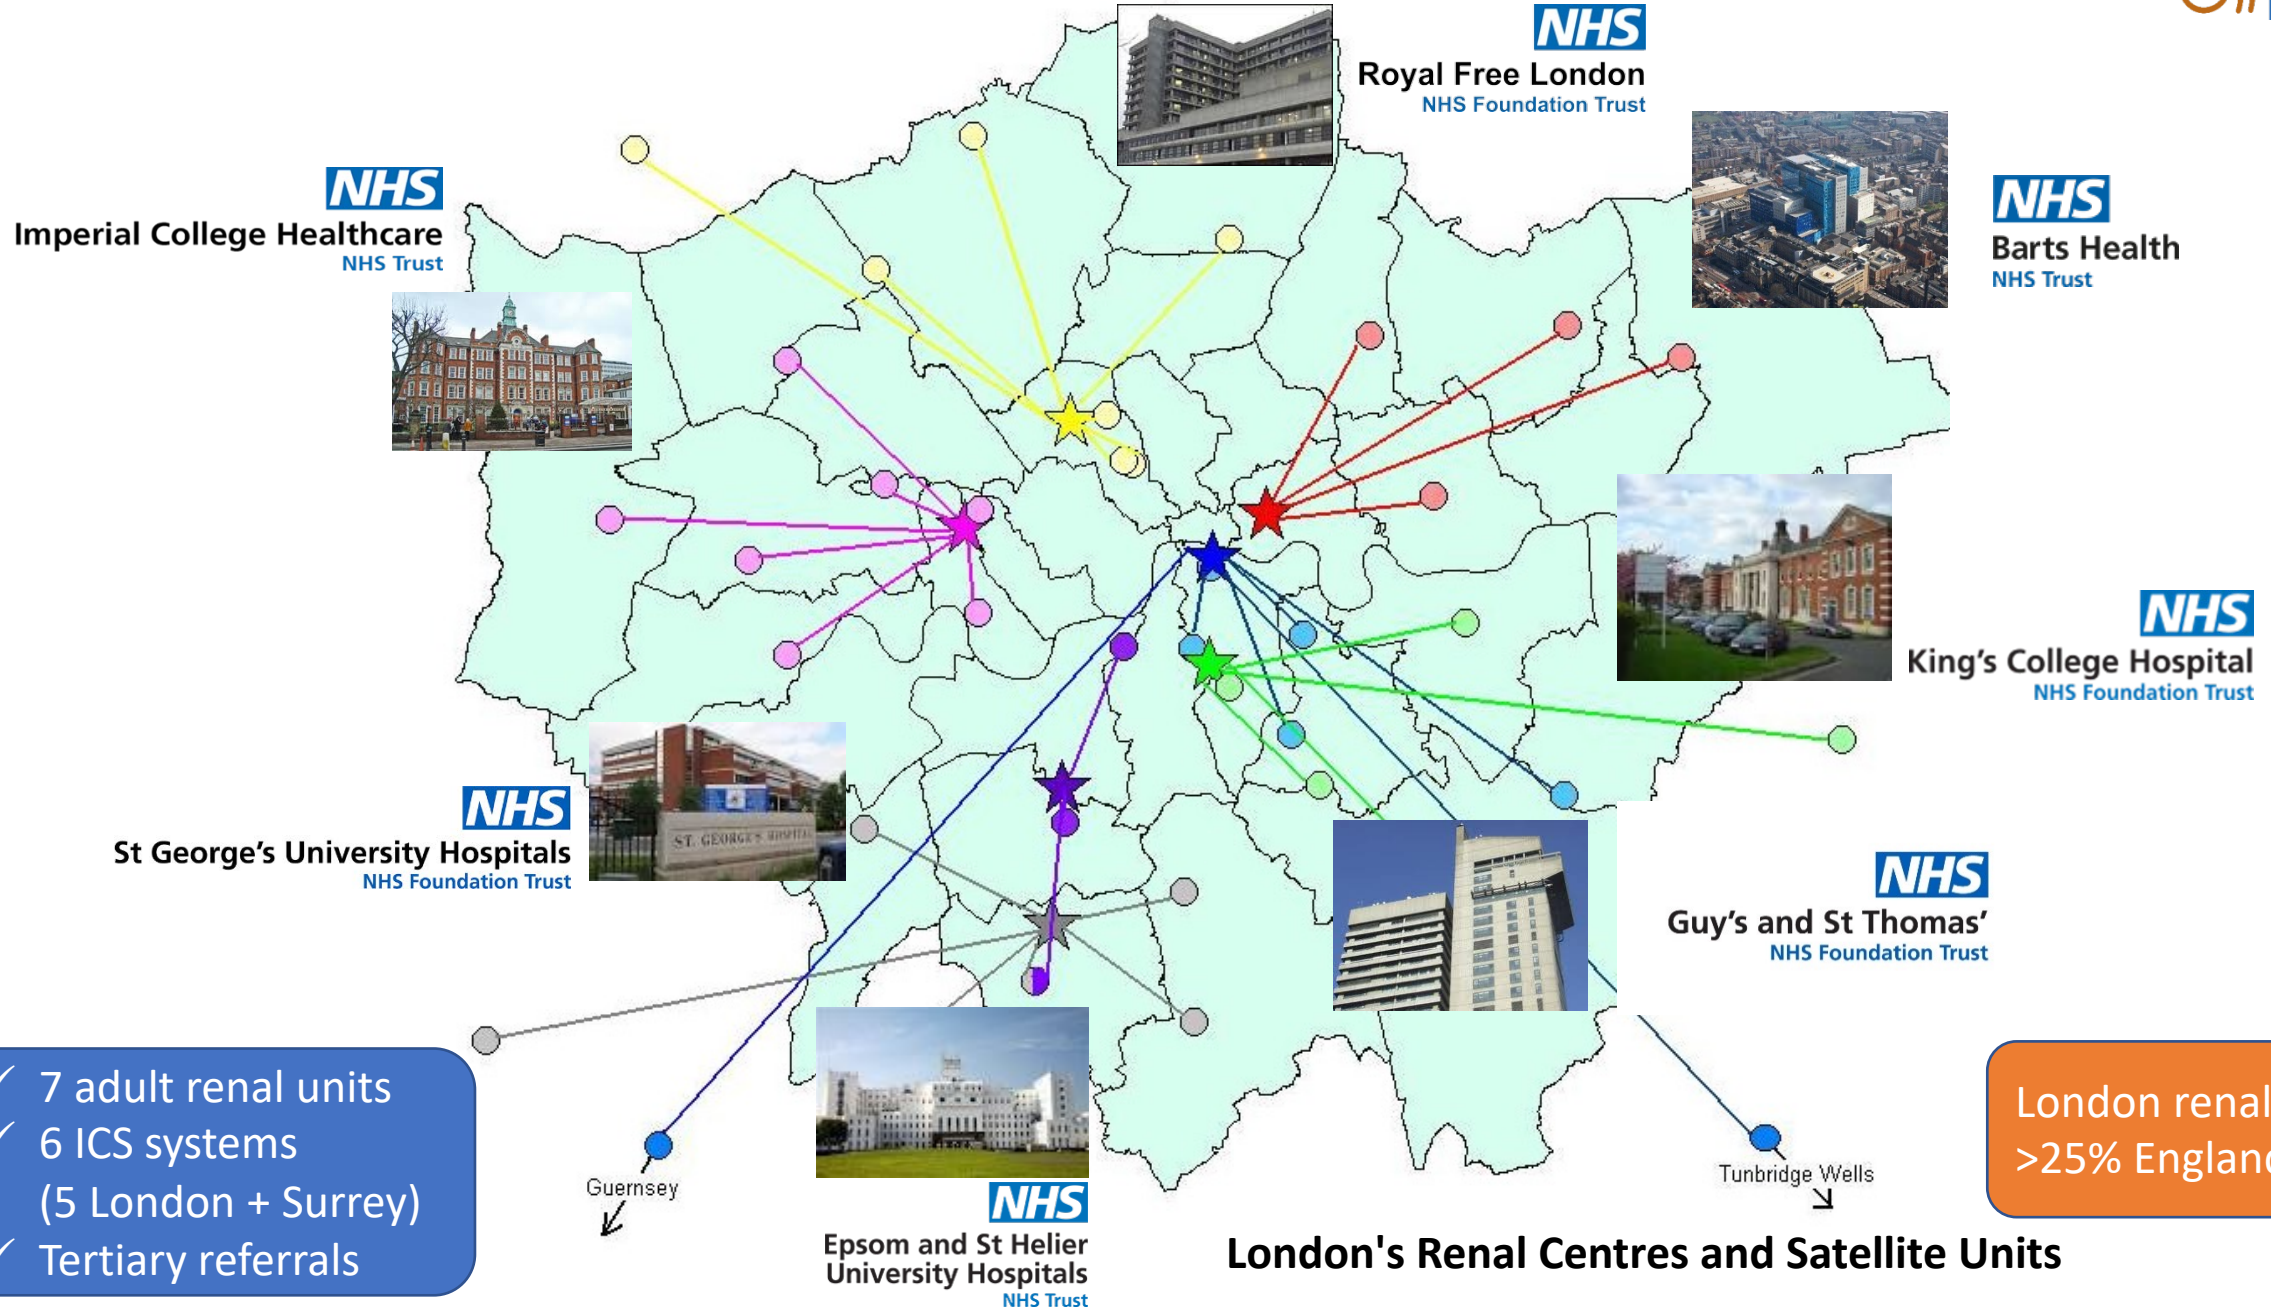

Figure 1. Kidney Outcomes.

Outcomes were assessed in time-to-event analyses. Panel A shows the primary composite outcome of kidney failure, a sustained decrease of at least 40% in the estimated glomerular filtration rate (eGFR) from baseline, or death from renal causes in the finerenone and placebo groups. Panel B shows a sustained decrease of at least 40% in the eGFR from baseline maintained for at least 4 weeks (a component of the primary composite outcome). Panel C shows kidney failure (defined as end-stage kidney disease or a sustained eGFR of <15 ml per minute per 1.73 m² of body-surface area, confirmed by a second measurement ≥ 4 weeks after the initial measurement); end-stage kidney disease was defined as the initiation of long-term dialysis or kidney transplantation. Panel D shows the secondary composite kidney outcome of kidney failure, a sustained decrease of at least 57% in the eGFR from baseline (equivalent to a doubling of the serum creatinine level) maintained for at least 4 weeks, or death from renal causes. Insets show the same data on an enlarged y axis. CI denotes confidence interval.

How can we use this data locally? Learning from SWL

Where are the SWL Core20 population of 340k located?

Main features of population:

- **Ham, Petersham and Richmond Riverside** (2K) Older population. Significant White British population.

- **Beverley** (2K) More school and young working aged population. More of the Asian & Mixed ethnicities.

- **Berrylands** (2K) More young working age population. More of the Arab/Middle Eastern ethnicities.

- **Sutton Central** (6K) Significant school aged population. Deprivation in housing, income & environment. Significantly more South Asian & Chinese ethnicities.

- **St Helier & Wandle Valley** (14K) More school & retirement aged population. Significantly more White British and Eastern European ethnicities.

- **Queenstown** (9K) Young adult to working age population (15-44). Significantly more Black & Chinese ethnicities. Barriers to housing and living environments

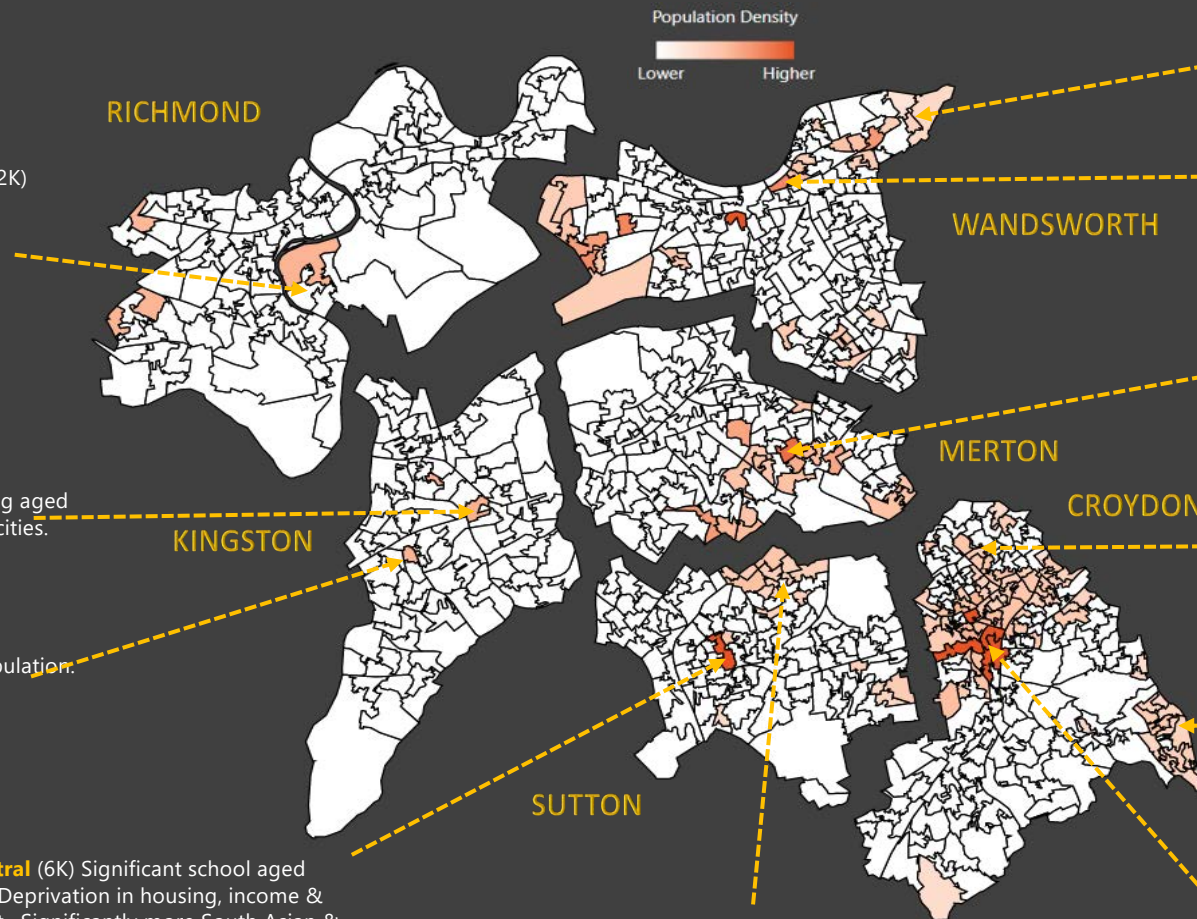

- **Latchmere** (14K) Younger working age population. More Black ethnicities. Barriers to housing

- **East Merton** (29K) Deprivation in housing and environment. Significant school aged and older working age (44-64) population. Ethnically diverse.

- **Croydon North** (89K) School and working aged population. Significantly more Black & Asian ethnicities. Barriers to housing.

- **Addington** (24k) High school aged population. Very high deprivation driven by income, employment, education and barriers to housing. Significantly White British and Black African

- **Fairfield** (21k) Young adult to working age (15-44), adversity in living environment, housing & crime. Significant Indian ethnicities.

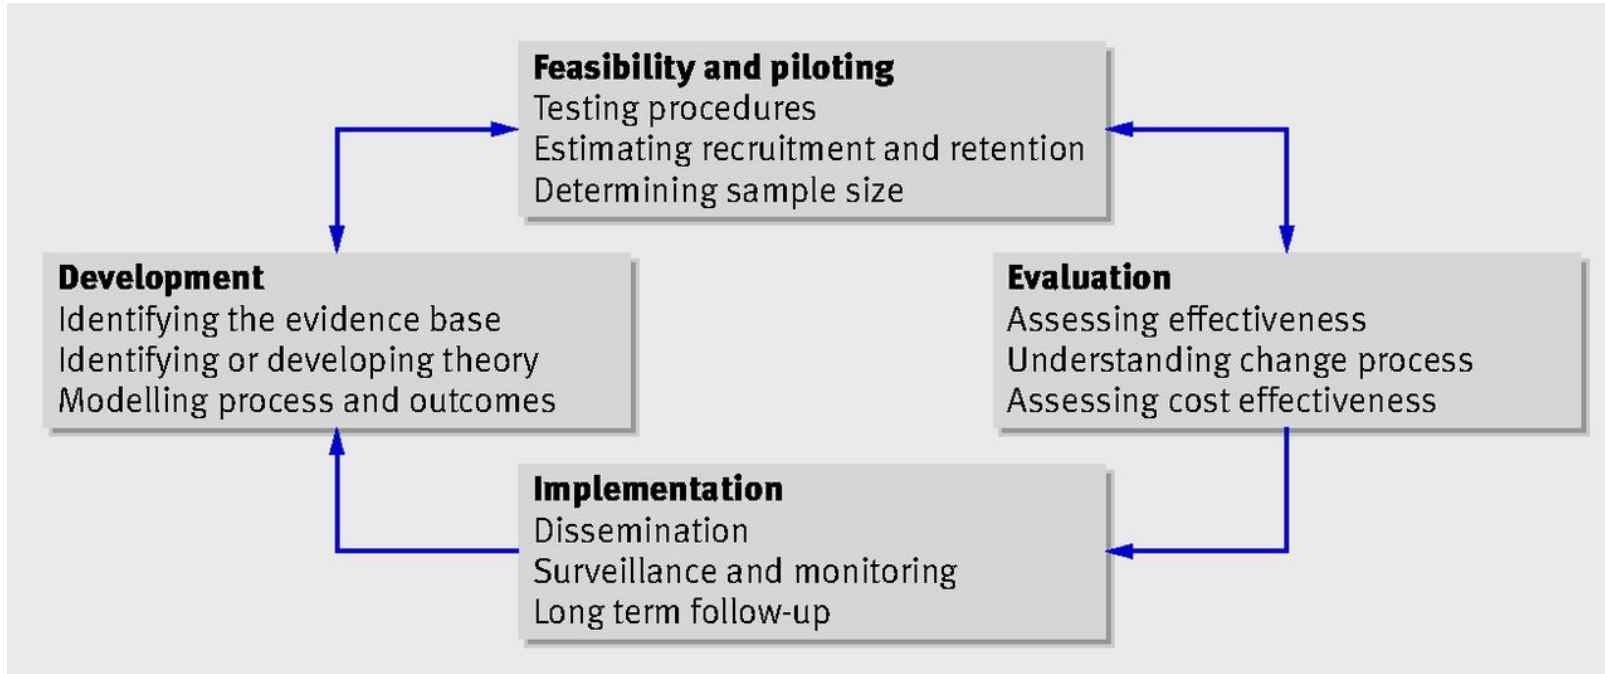

Opportunity for change KEY: ● High ● Medium ● Low

Summary of key learning points

-  CKD is common
-  CKD is associated with high rates of CVD, hospital admissions and mortality
-  Strong associations between CVD and CKD risk and outcomes
-  Prevention of CKD progression can reduce CVD, End Stage Kidney Disease and mortality
-  Both ACR and eGFR testing are important for early identification.

Summary of key learning points

-  We need to understand our own local population, and see where health inequalities exist
-  A change in our approach is needed, to engage with people at greatest risk of CKD
-  The greatest benefit lies in both improving detection *and* optimising treatment in these at-risk groups
-  The time to act is now!

Peter Craig et al. BMJ 2008;337:bmj.a1655
